

MULTI-PARTY SOLUTIONS

Inference provides significant advantages for management of complex multi-party eDiscovery and legal review. As a secure, web-based solution, Inference can be accessed anytime, anywhere using a standard web browser.

Multiple data sources and deliveries provided in standard load file formats can be rapidly uploaded so that users can quickly begin using Inference's powerful dynamic analytics and review toolset without the need to re-process data. Production is performed through standard protocols, and users have the power to print deposition and witness kits directly from the system, and at no cost. The key benefits of using Inference for multi-party cases include:

Conceptual Analytics for Investigation & Prioritization. Inference is the first user-driven eDiscovery platform to address the need to quickly and thoroughly analyze entire datasets. With Inference's suite of conceptual analytic tools, features like Clustering and Show Similar enable dynamic investigation, acceleration and prioritization of data to dramatically streamline review.

Post-Production Analysis. Each party involved in a litigation typically knows and understands their own production data, but often are required to review other parties' data for related information. Inference analytics features, especially the Show Similar function, help users to quickly and easily find related documents within opposing counsel, as well as joint defense, productions.

Complete Review Toolset. Inference is highly configurable and offers a full set of review and workflow tools, including custom issues and subjective coding, redaction, enhanced printing, Query Refinement, and security features.

Acceptance of Post-Processed Data. Unlike other tools that offer Clustering, Inference has the ability to index standard load files from any existing EDD process, and our expert data team analyzes and uploads data at a rate of 500,000 documents per day.

Unmatched Scale & Search Speed. Inference's distributed, fully load balanced architecture delivers unmatched speed and system responsiveness to perform searches, analytics operations and review actions to accelerate the overall discovery and review process.

Expert Project Management & Consultation. The Inference Client Services group consists of highly experienced professionals from the electronic discovery, legal and technology industries from both client and vendor perspectives. Inference takes a consultative approach to project management, helping to address unique case requirements, effectively train users and manage coordination between parties and at no cost to the client.

User, Group & Document Level Security. Inference has integrated multiple levels of user access security including field level for public, private and shared access, closed user groups to maintain protection between and among firms, and document level security for database segregation and enhanced workflow.

Secure ASP Hosting. Inference and all client data is hosted in N+1 secure, SAS 70 co-location facilities with fully redundant power, environmental, communication and firewall protection as well as comprehensive daily backups.

Efficient Billing Management. Inference offers a systematic and predictable approach to billing, ensuring accurate monthly invoicing across parties, including law firms and corporations.
