

# POST-PRODUCTION REVIEW

---

Post-Production Review is a critical period of the discovery lifecycle when attorneys are focused on finding key documents to win a case. Inference provides significant advantages for a post-production analysis and review through an advanced conceptual analytics suite, complete review toolset and unmatched system speed and scalability. Inference allows you to take control of your review through dynamic investigation and analysis tools, configurable workflow and advanced prioritization capabilities. Key benefits include:

***Quickly and confidently target key issues and documents from opposing or co-counsel productions.***

By leveraging Inference's analytics suite, including Clustering, Concept Direct and Show Similar features, users can search, cross-reference and prioritize critical data from opposing counsel or co-counsel productions based on the concepts found in the document population.

***Easily prepare depositions and witness kits directly from the system.*** With Inference's Enhanced Printing features, users can prepare critical case documents for deposition preparation and witness kits with headers, footers, watermarks and table of contents on the fly, and at no cost.

***Save significant time and costs on processing.*** Inference is data agnostic and capable of accepting standard load files from any EDD vendor, eliminating the need to re-process data.

***Immediately review new datasets and collections with rolling deliveries.*** Inference supports data uploads on a rolling basis without the need to re-index. As a result, Inference users do not experience system downtime or interruption in service, allowing for consistently accessible review data.

***Apply issue-based workflow with combined keyword & concept search.*** Users can search across the entire repository using fielded and keyword queries, conceptual search, or a combination of both, to target critical areas and drive the direction of post-production review.

***Speed review with advanced concept analytics.*** With Inference's dynamic analytics features, users can identify important concepts and relationships between documents to quickly investigate key issues and significantly accelerate review.

***Find related concepts and documents across the repository with Show Similar.*** Utilizing Inference's Show Similar feature, users can instantly search across the entire data population to find conceptually related documents, duplicates and discussion threads.

***Quickly and accurately search across OCR data populations.*** Inference's architecture provides unmatched scale and responsiveness when searching the millions of terms generated by the OCR process, and its analytics features dramatically increase search accuracy because users can focus their attention on the concepts and issues inherent in a matter.

***Share data while protecting work product.*** Inference's field and document level security features allow multiple firms to access the same data population without compromising work product.
