

# SYSTEM SECURITY

Data security is a core principle of Inference Data's business and operations. Inference has been designed and implemented with stringent measures to prevent security breaches or compromises of client data at the application, network and physical layers - including:

## ACCESS & USER LEVEL SECURITY

Inference has integrated multiple levels of user access security including field, feature and group levels. Field level security enables administrators to customize the specific fields individual users can see and have access to. This feature allows different parties to only see the fields to which they have access rights to, while still enabling certain fields to be shared amongst users and groups. These settings are customizable at both the repository and user levels.

Inference also utilizes "closed user groups". This security feature allows administrators from different firms, or from corporate counsel, to configure which users and features will be visible from within the same repository, including advanced features such as Clustering and Shared Queries. Moreover, Inference employs function level security to enable or disable certain features for those users who should not have certain levels of access or feature rights.

Case objectives regarding field, user and group level security are addressed at the time of site consultation and set up to ensure that security preferences and requirements are deployed appropriately.

## APPLICATION LEVEL SECURITY

- Secure access transaction via VeriSign SSL 128bit encryption
- Secure access by IP address identification
- Real-time virus protection on all servers

## PHYSICAL INFRASTRUCTURE

- N+1 secure and SAS 70 Level co-location facilities
- Regularly tested security building and data center access
- Fully redundant firewall protection
- Application data separation via firewall access control lists
- Daily secure system back-up
- 24-hour intruder detection monitoring
- Redundant power and environment systems
- Active facility and server monitoring management
- Card key and biometric security levels for data center access

As part of our security standards, we do not publish specific details of architecture, equipment, or software versions. Inference Data's technical team is available to discuss security specifics with the appropriately qualified individuals for detailed reviews.
